Athena Si (Silica)

Athena Silica Columns is fit for separation of non-polar and media polar organic compounds to achieve sharp peak shape and High reproducibility for columns.

Athena C4

Athena C4 column has less retention of compounds. It is a better choice when faster analysis is needed than C8 or C18 columns.

Athena C8

Athena C8 column has less retention of compounds. It is a better choice when faster analysis is needed than C18 columns. The high quality packings provide excellent peak shape and long lifetime.

Athena WPH-C18

Routinely used against waters XTERRA C18MS and WATERS XBRIDGE C18 Columns ATHENA C18-XPB Column performance measured.

Athena C18-WP

Athena C18-WP HPLC Columns: The special bond technology of Athena C18-WP column enables the use of 100% aqueous mobile phase, which is necessary for some polar analytes.

Athena Sax

Cnwsil SAX columns are strong anion exchange columns, designed for the separation of small organic molecules and organic acids, especially for nucleic acids.

Athena NH2 (Amino)

Aminopropyl stationary phase server as aweak anion exchanger and offer polar selectivity under reversed phase an normal phase conditions.

Athena Hilic

Cnwsil HILIC columns are designed for the analysis of polar and hydrophilic compounds, e.g., amino acids, pyrimidine bases and nucleotides/oligonucleotides, alkaloids, carbohydrates and other small polar or ionizable compounds.

Athena CN (CYNO)

Athena CN is cyanide propyl bonded silica column with n-electron interaction and unshared electron pair hydrogen bonding. Can be used for both normal phase and reverse phase mode.

Exsil Pure

We make everything - from the silica particle to the finished product. Our unique manufacturing process allows to deliver the highest performance at an exceptional value!

Exsil Plus

Exsil Plus Column; Type B versions of current Exsil products which provide superior results for difficult bases and chelates.

Exsil Mono

This product perfectly meets your various analysis needs with its high surface area and different pore sizes. The encapping feature ensures enhanced durability and reliable performance. It allows you to customize your analyses with different particle sizes and phase options.

Exsil Diametric

Exsil Diametric achieves this by diametrically opposed hydrophobic and silanophilic selectivity compared to standard C18 phases.

Exsil Clasico

Other phases are in development and we can supply these for specific problems where the Exsil 80/100 equivalent is not fully compatible

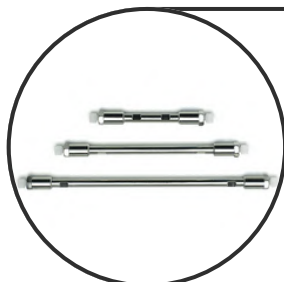

Exsil Avanti

The Avanti range was developed to meet the need for a range of phases based on a Type A silica which are less retentive than the standard 80 and 100 ranges and provide a closer match to current established commercial 120 - 150Å media.

Exsil Avanti BDS

The Avanti BDS range was developed to meet the need for a range of base deactivated reversed phases based on a Type B silica which are less retentive than the standard 80 and 100 ranges and provide a closer match to current established commercial BDS 120 - 150Å media.

Exsil 80

The Exsil 80 range has a higher surface area and greater retention than the original Exsil 100 which in some instances provides a better alternative to Spherisorb.

Exsil 100

The original Exsil 100 range was dev to provide an alternative to Spherisorb type products. The extensive range of bonded phases includes novel phases such as ODS-B and Octyl-B which are so deactivated they can chromatograph strong bases in buffer-free eluents.

Exsil 120 Pragon

Exsil reversed phase silicas have an outstanding record for reproducibility and are available in a wide range that offers alternative selectivities to conventional reversed phase media.
